Non-Training Build Report

EnvLoop / 3 October 2026

Scope: executable infrastructure and independently checked controls. This report contains no full-study model result or measured training gain.

Updated: 3 October 2026. This dated snapshot assumes Tinker is unavailable. It records executable infrastructure and independently checked controls. It contains no model-performance result or measured training gain.

Executable components

The actual Linux amd64 build passed CI, network-isolated smoke checks and registry push. The public release includes a deterministic source archive, complete file manifest and smoke receipt. Root independently reopened all 1,720 archived files and anonymously downloaded all eight release assets with byte equality. Tinker is excluded, and these checks made zero model or training requests.

Cell	Implementation	Verified evidence	Remaining execution
Excel web	Original Office worker and rich SEC factory	Offline checks retain 140 original packages, 1,997 numeric facts and 9,985 formula targets	Current native cloud edit, save, download and reset controls
PowerPoint web	Original Office worker and WDI factory	Real TRAIN upload, equivalent downloads, distinct reset and empty-folder cleanup under an earlier source	Current Host7 native-picker lifecycle; last attempt stopped at Mac lock before file input
Desktop	Calc, Writer, Impress and native Source52	Fresh Source52 Impress saved 0/1/0 trio, exact resets and six distinct guests; current Calc baseline passed	Calc positive stopped before Save proof; fresh repair and current Calc/Writer trios, then original cohort qualification
Odoo Community	Native14 and Qualification9	All original selection20 saved 0/1/0 controls, exact resets, protected state and complete source visual review	Complete final cohort qualification and model evaluations
GitLab CE	Original Source146 and selection reference controller	Three neutral cycles; TRAIN native 1/0/1; policy, CSV, linked-items and activity rendering	First selection baseline stopped on exact project-URI check; diagnosis and fresh controls pending
Magento	Native10 and selection reference controller	TRAIN 0/1/0, native source read/Close and exact reset; first selection baseline and positive passed	Original selection20 run in progress; whole trios and source review remain pending

Passed reference controls test the environment and verifier. They do not count as model evaluations. Earlier-source Calc and Writer controls remain dated evidence and receive no automatic Source52 credit.

Evidence and publication

Source release: <https://github.com/EnvLoop/cua-rsibench/releases/tag/v0.6.8-non-training-readiness>

Verified build: <https://github.com/EnvLoop/cua-rsibench/actions/runs/37118914429>

The image was pushed to GHCR, but organization policy disables public package visibility. Anonymous image pull has not passed. The public source archive can be built independently. Office uses the existing account and owned folder; no second account is required. Account identifiers, credentials, private instructions, hidden allocation and gold state remain outside the public distribution.

What remains before model results

Finish the owned application controls and independent source review. Preserve each failed attempt, review any additive repair, and use a fresh evidence namespace. Qualify the original selection and final cohorts under their current source, including saved readback, protected collateral state, distinct reset and resource cleanup. Do not replace these gates with portable imports or artifact-only tests.

The full protocol remains four researcher configurations by six software cells, with 20 selection and 100 final tasks per cell. Current official totals are 0/600 admitted final identities, 0/24 completed researcher chains and 0/3,000 reconciled matched model outcomes. Training, checkpoint selection and the trained-versus-base comparison resume only when the training provider is available. The final empirical paper requires those completed and audited results.
